

Newsletter Spain – February 2021

According to the official harvest declaration, the 2020 harvest has been 45.8 million hectoliters, 40.7 million hectoliters of which are wine and 5.1 million hectoliters must. Castile La Mancha is the largest producer with 59% of the total production, that is 23.9 million hectoliters of wine plus 4.55 million hectoliters of must (which corresponds to 90% of the national must production), a total of 28.45 million hectoliters. 2.73 million hectoliters were produced in Extremadura, 2.35 million hectoliters in the Region of Valencia, 2.25 million hectoliters in Castile and Leon, 2.24 million hectoliters in Catalonia, 2.0 million hectoliters in La Rioja and 1.27 million hectoliters in Aragon.

Under normal circumstances, a harvest of 46 million hectoliters would not be too problematic for the market, the surplus would increase slightly, but it would not be a problem to sell this quantity. But under the current circumstances, volume is becoming a difficult problem and we believe that selling large volumes of wine will end up being complicated because selling that volume will no longer be a question of price. In addition, domestic consumption has fallen, due to the lack of tourism, from 11 million hectoliters to 9 million hectoliters, which corresponds to 19.69 lts. per person per year.

Against this background, the wine sector has requested a crisis distillation of 9 million hectoliters for 2021, divided into at least one million of hectoliters for wines with DO, another for IGP wines and the remaining for generic table wines. Spain is making all economic efforts to pull wine out of the wine market to reduce inventory levels. And they have to do so as quickly as possible, because if it is only done in May and June, as last year, it would have little effect on the markets.
